# Rapid bearing replacement • Cost savings • Application examples

## Rapid bearing replacement at difficult to access locations

Split spherical roller bearings are principally used where the replacement of unsplit spherical roller bearings would require costly additional work, involving the removal of gears or couplings, the dismounting of drives or the dismantling of shaft power trains. The use of split spherical roller bearings reduces the downtime of machinery and plant.

## Application examples

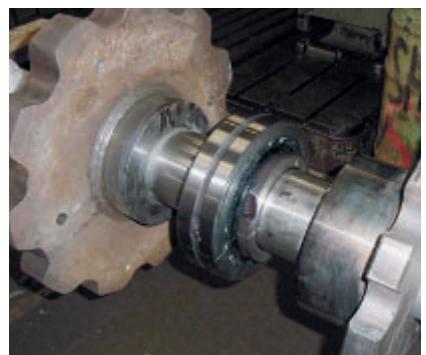

Split spherical roller bearings are essentially used on shafts supported at several points and locations that are difficult to access. Typical areas of application include conveying equipment, materials processing plant, ventilation plant, rolling mills, ships and paper machinery.

Application examples in mining and materials processing:

- Bucket wheel excavators and reclaimers
- Winches and sheaves
- Worm conveyors
- Bucket conveyors and belt conveyors
- Mixing and stirring plant
- Mills and crushers
- Sintering plant, drum type kilns
- Fans and ventilators
- Dust extraction plant
- Drive and transmission shafts

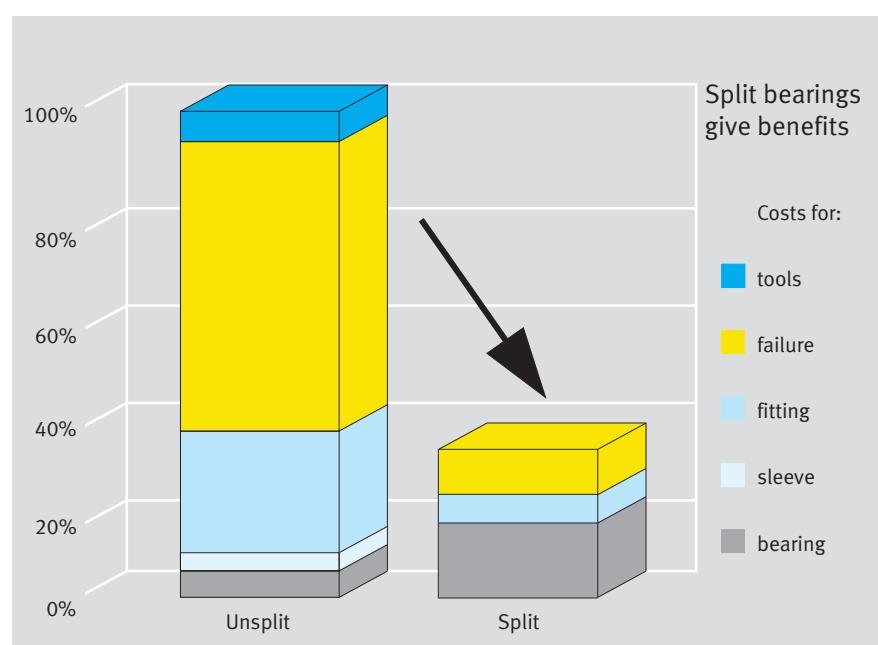

Bearing arrangements in comminution and processing plant

Drive bearing arrangements in conveying and transport equipment

## Cost savings

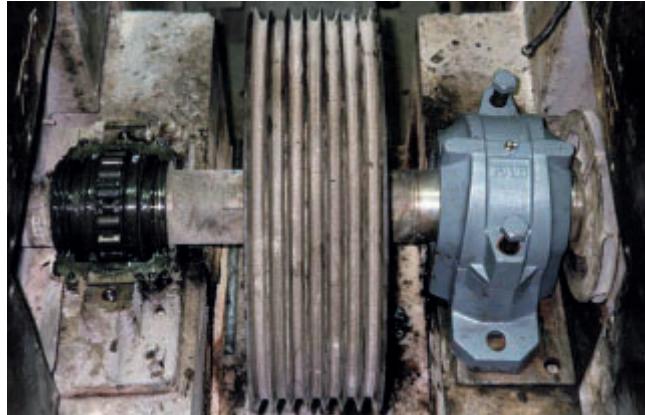

Due in particular to the reduced downtime, the fitting of split spherical roller bearings gives a significant reduction in fitting costs, as shown in the diagram. In new designs too, split spherical roller bearings can give cost savings in many cases since the plant can be simplified and the assembly work required is reduced.

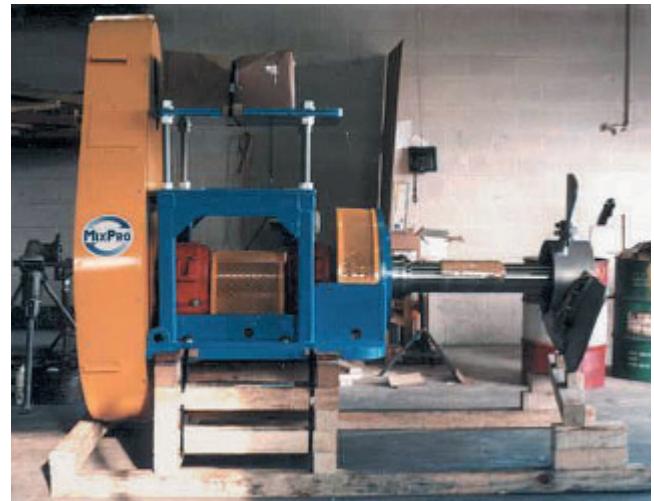

## Application examples

Application examples in the pulp and paper industry:

- Fans and ventilators
- Mixing and stirring plant
- Dryer rolls
- Drive and transmission shafts
- Conveying equipment
- Comminution machinery

Drive bearing arrangements in conveying and transport equipment

Bearing arrangements in fans and ventilators

Fitting of a large split spherical roller bearing

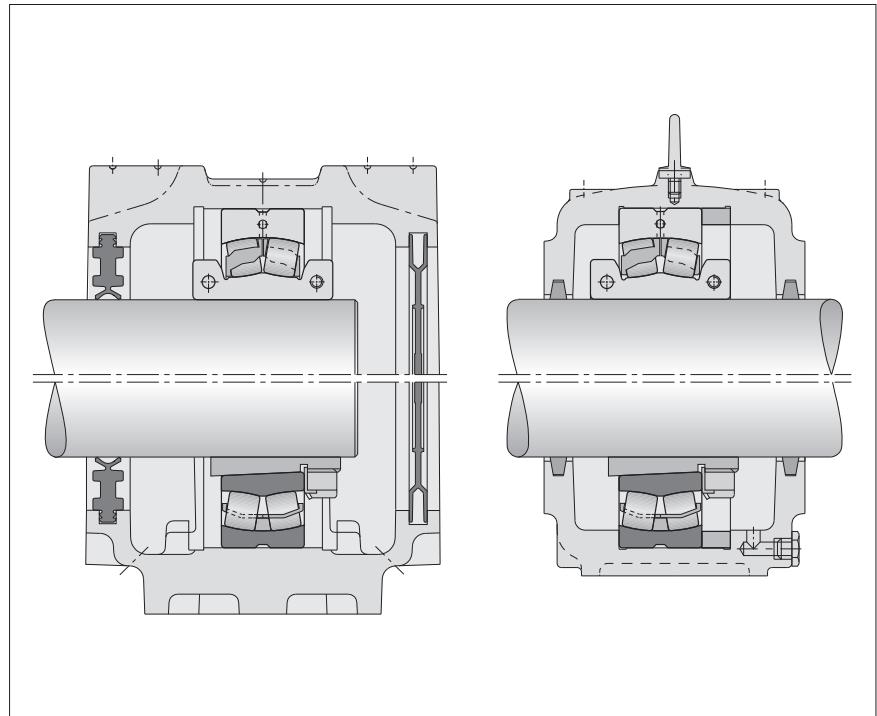

# Replacement for bearings with adapter sleeve · Fitting in split plummer block housings

## Replacement for bearings with adapter sleeve

Split spherical roller bearings can generally be fitted instead of unsplit spherical roller bearings with adapter sleeves. The precondition for replacement is that the outside diameter, outer ring width and diameter of the shaft seat are identical, see Product range, page 5.

## Fitting in split plummer block housings

Split spherical roller bearings can be fitted in our split plummer block housings without additional machining of the housings. This also applies to housings from other manufacturers if the internal dimensions are identical.

1: Easy bearing replacement since the mounting space of split spherical roller bearings (top) is identical to that of unsplit spherical roller bearings with adapter sleeves (bottom).

2: Simple inspection, rapid and simple fitting – the split spherical roller bearing to be fitted in an SNV housing

# Product range • Bearing design

## Product range

Our comprehensive range contains split spherical roller bearings for metric shaft diameters from 55 mm to 630 mm and inch shaft diameters from  $2\frac{3}{16}$  inch to 16 inch.

In most cases, the outside diameter, outer ring width and diameter of the shaft seat are identical to those of standard spherical roller bearings of series 222, 230, 231, 239, 240 and 241 with appropriate adapter sleeves.

The bearing tables show which standard bearing with a sleeve can be replaced by the relevant split bearing.

## Bearing design

Split spherical roller bearings have a cylindrical bore. The inner ring, outer ring and cage with the roller set are split in half. The split bearing rings are held together by screws.

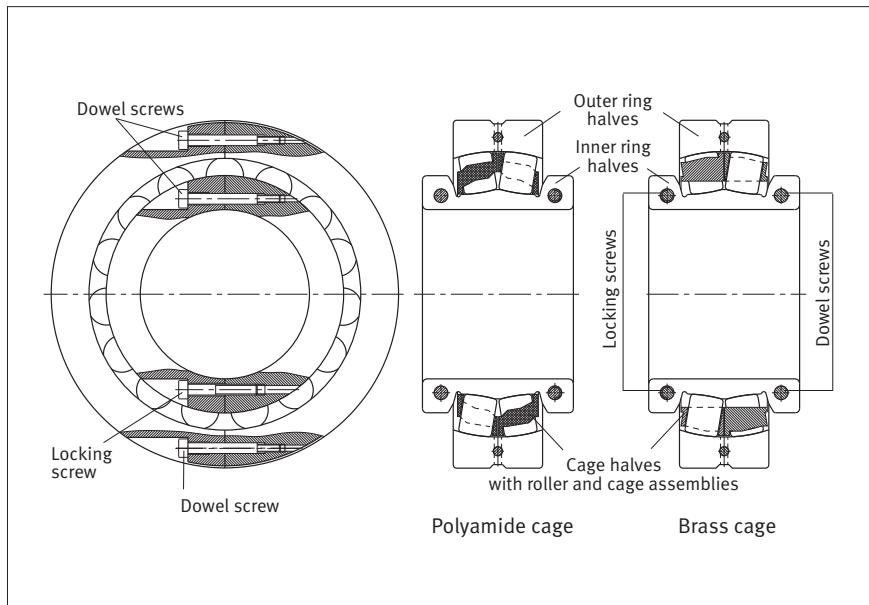

The internal design of most split spherical roller bearings was carried over from our proven spherical roller bearing E1, Figure 3. The only difference is that some larger bearings have a rigid central rib on the inner ring.

The bearings have a split solid cage made from glass fibre reinforced polyamide or brass (for high temperature suitability, see Catalogue HR 1, Rolling Bearings).

Split spherical roller bearings have the normal tolerances of unsplit radial bearings and the normal internal clearance of unsplit spherical roller bearings with a cylindrical bore (DIN 620). In most split spherical roller bearings, the locking rings are integrated in the inner rings, Figure 4.

4: Split spherical roller bearing with split solid cage made from glass fibre reinforced polyamide or brass, with integral locking rings

3: The internal design of the bearings with integral locking rings matches that of the proven E1 design.

If there are large differences in temperature between the shaft and inner ring halves, which can occur for example in dryer rolls for paper machinery, bearings with separate locking rings are more suitable, Figure 5.

5: Split spherical roller bearing for special applications with separate, split locking rings

# Load carrying capacity · Speed suitability · Fits · Lubrication

## Load carrying capacity

The load carrying capacity of split spherical roller bearings is lower than that of unsplit spherical roller bearings, since the pitch circle for the rolling element set is smaller due to the screw connection in the outer ring. Nevertheless, they can achieve a high load carrying capacity since they have the maximum number of rollers with the largest possible dimensions (E1 design). The overrolling of the joints is taken into consideration in calculation of the equivalent dynamic load by applying the shock factor 1,1. Dimensioning is carried out according to the normal calculation method from Catalogue HR 1, Rolling Bearings.

## Speed suitability

The limiting speeds are stated in the bearing tables. The values take account of the cage strength and the vibrations generated through overrolling of the joints. If the limiting speeds are exceeded, consultation with Application Engineering is required.

## Minimum load

For bearings running at high speeds in particular, a minimum load is required in order to ensure problem-free operation. For these bearings, this is:

$$P = 0,02 \cdot C_r$$

P [kN] Minimum radial load

C<sub>r</sub> [kN] Basic radial load rating from dimension tables

## Fits

In order that the inner rings have the necessary firm fit once the screws have been tightened, the shaft must be machined to between h6 and h9. These shaft tolerances are the same as those normally used with unsplit bearings located by means of adapter sleeves. The housing bore is normally machined to H7 or H8.

## Lubrication

Split spherical roller bearings are normally lubricated using lithium soap grease of consistency class 2 with EP additives. The lubrication intervals correspond to those of unsplit bearings. Split spherical roller bearings can also be relubricated via a groove and holes in the outer ring.

## Automatic lubricators

It is particularly advantageous to use split spherical roller bearings in conjunction with a Motion Guard automatic lubricator. Through controlled relubrication, this continuously supplies a sufficient quantity of fresh grease to the contact points of the rolling bearing. This results in a significant increase in bearing life. These reliable, economical devices give extended lubrication and maintenance intervals and also prevent undersupply or oversupply of grease.

Plant downtime and maintenance costs are reduced as a result. The sparing and environmentally friendly use of lubricants contribute to higher cost-efficiency. Comprehensive information on the Motion Guard lubricators "Champion", "Compact" and "Concept6" is given in publication WL 80 346.

# Fitting

## Fitting of split spherical roller bearings

The following pictures give a summary of the operations in the fitting of split spherical roller bearings. Each bearing is supplied with a comprehensive fitting manual.

1 Support the weight of the rotor

2 Remove the housing cover

3 Dismount the old bearing (unsplit bearings with adapter sleeve should be carefully cut through using a parting-off grinder)

4 Place the outer ring half in the lower section of the housing and align it with the inner ring mounted on the shaft, then screw together the inner ring halves

5 Fit the remaining parts, finishing with the upper outer ring half

6 Lower the shaft in order to subject the bearing to load

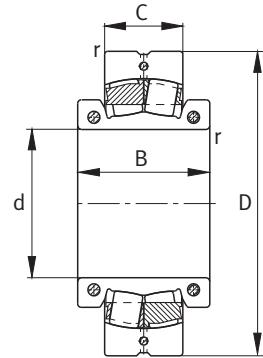

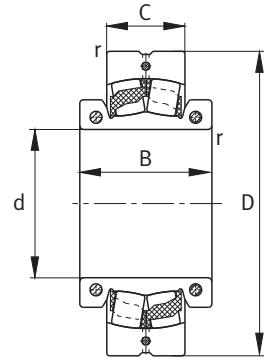

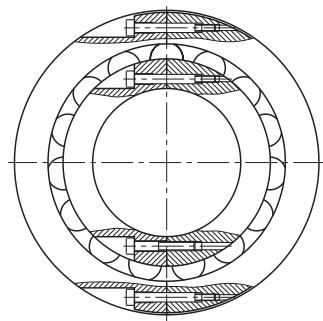

7 Fit the upper section of the housing

Other designs are also available; please contact us.

#### Equivalent dynamic load

$$P = 1,1 (F_r + Y_1 \cdot F_a) \quad [kN] \quad F_a/F_r \leq e$$

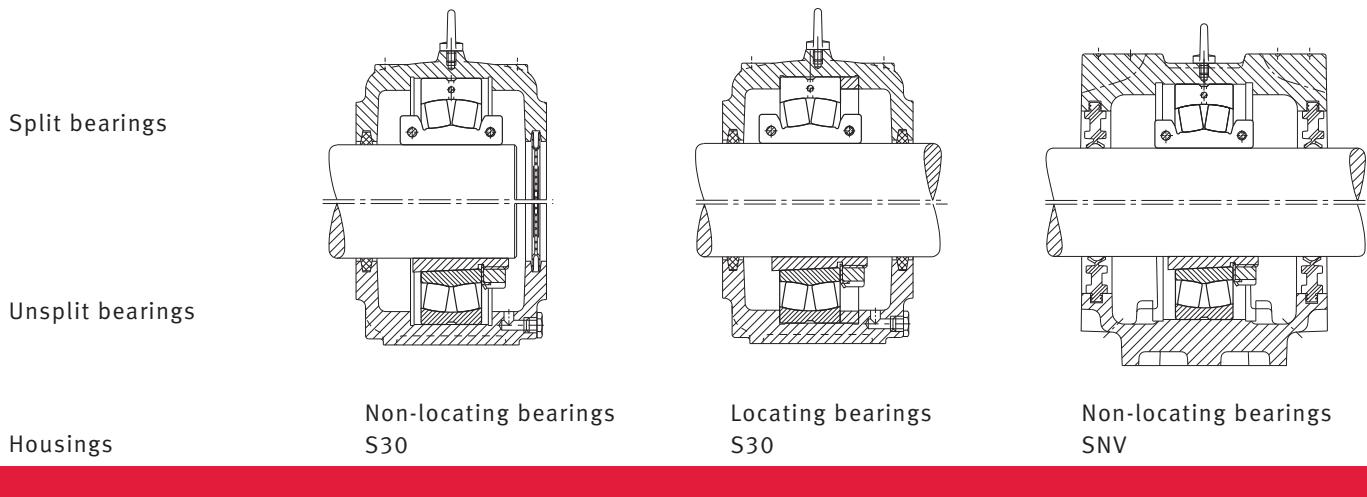

$$P = 1,1 (0,67 \cdot F_r + Y_2 \cdot F_a) \quad [kN] \quad F_a/F_r > e$$

#### Equivalent static load

$$P_0 = F_{0r} + Y_0 \cdot F_{0a} \quad [kN]$$

In order to prevent creep of the inner rings in a circumferential direction on the shaft,  $P/C_r$  must be  $\leq 0,2$ . Higher values are permissible if the actual speed is significantly lower than the limiting speed. In such cases, please contact us.

Other designs are also available; please contact us.

#### Equivalent dynamic load

$$P = 1,1 (F_r + Y_1 \cdot F_a) \quad [\text{kN}] \quad F_a/F_r \leq e$$

$$P = 1,1 (0,67 \cdot F_r + Y_2 \cdot F_a) \quad [\text{kN}] \quad F_a/F_r > e$$

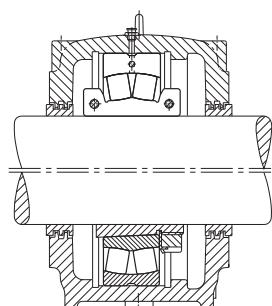

#### Equivalent static load

$$P_0 = F_{0r} + Y_0 \cdot F_{0a} \quad [\text{kN}]$$

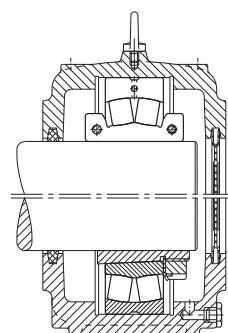

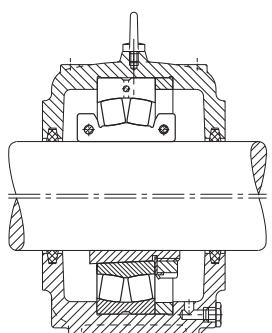

In order to prevent creep of the inner rings in a circumferential direction on the shaft,  $P/C_r$  must be  $\leq 0,2$ . Higher values are permissible if the actual speed is significantly lower than the limiting speed. In such cases, please contact us.

Other designs are also available; please contact us.

#### Equivalent dynamic load

$$P = 1,1 (F_r + Y_1 \cdot F_a) \quad [\text{kN}] \quad F_a/F_r \leq e$$

$$P = 1,1 (0,67 \cdot F_r + Y_2 \cdot F_a) \quad [\text{kN}] \quad F_a/F_r > e$$

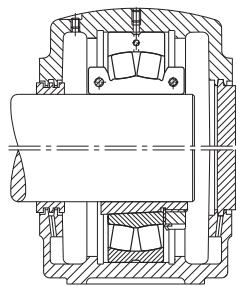

#### Equivalent static load

$$P_0 = F_{0r} + Y_0 \cdot F_{0a} \quad [\text{kN}]$$

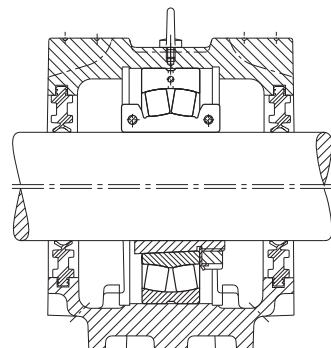

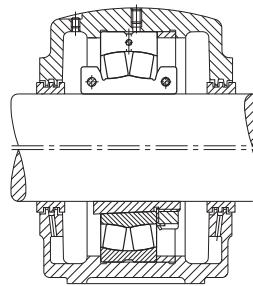

In order to prevent creep of the inner rings in a circumferential direction on the shaft,  $P/C_r$  must be  $\leq 0,2$ . Higher values are permissible if the actual speed is significantly lower than the limiting speed. In such cases, please contact us.
